

README: Guess the Mystery Word

Author: Yash Dwivedi

Overview

"Guess the Mystery Word" is a terminal-based Python game developed for the CSE (Problem Solving) curriculum. The game challenges players to solve technical and general riddles across three distinct levels. It emphasizes procedural programming, loop control, and terminal string formatting.

Features

- **Three-Tiered Challenge:** Levels progressing through words like "Algorithm", "Variable", and "Medicine".
- **Robust Input Handling:** Ensures user guesses are evaluated accurately regardless of case input.
- **Terminal Formatting:** Implements ANSI escape codes for a polished Command Line Interface.

Technologies / Tools Used

- **Programming Language:** Python 3
- **Core Focus:** Procedural Logic, Nested Loops, String Manipulation

Steps to Install & Run

```
# 1. Ensure Python 3 is installed on your system.  
# 2. Save the script as `guess_word.py`.  
# 3. Open your terminal or command prompt.  
# 4. Run the application:  
python guess_word.py
```

Instructions for Testing

Run the script and test the following scenarios to validate the problem-solving logic:

- Enter the correct answer on the first try to verify level progression.
- Enter incorrect answers to verify the attempt countdown works and triggers a "GAME OVER" state.

- Enter answers in lowercase to verify the `.capitalize()` function correctly normalizes the input.
